

Mitch Milam's WPDOS 5.1 Macro Printer
WPUiverse.com
By Edward Mendelson

Mitch Milam's Macro Printer belongs in every WP 5.1 macro programmer's toolbox. This program can "print" 5.1 macro files either to plain text or to a WP file (plain or with line numbering), or it can print the macro file to a printer. The output can be customized in various ways for legibility.

This was commercial software when it first appeared fifteen or so years ago. Mitch Milam has now made it freely available to anyone who wants it. The included MACROPTR.ZIP file contains the program and its help file, plus a text file with installation instructions.

Note that it comes with no tech support of any kind.

(If you don't have a printer attached to LPT1, use the technique described at <http://wpdos.org/winprint.html> for printing from DOS applications to USB or networked printers under Windows.)

For Mitch Milam's report on how this program got started, please see his blog [here](#).
