

Two Different Page Numbers on One Page  
WordPerfect Magazine  
Q&A

Q: Is it possible to put two different page numbers on one page? I work with our company's quarterly report, and one page number must reflect the previous quarterly report number (1365, for example) at the bottom of the page. The other page number must reflect the current quarterly report number (Page 1, for example). What's the solution to this page numbering nightmare? – Anna L. Calhoun, Panama City, FL

A: The included SECPGNUM.WPM macro will do the job. First, you'll want to use WP's Page Numbering feature to insert your primary page numbers (Page 1, Page 2, etc.) at the top of your document. Then run the macro to insert the secondary page numbers. To use the macro, with your document on-screen place your cursor at the top of the page where you want secondary numbering to begin. Press Macro (Alt-F10), type "secpgnum" and press (Enter). You'll be asked what page number you want to start with. Type the beginning secondary page number and press (Enter). When the macro's done, press (Home), (Home), (Up Arrow) and view your document by pressing Print (Shift-F7) and (6) View Document. Press Exit (F7) to return to your document.

If you make any changes to the document after running the macro, the secondary page numbers may not be correct. For this reason, be sure to run the macro just before you print. If you do make changes and need to update the page numbers, run the macro again.

*Note: Any Footer B codes after your cursor position in the document are deleted when you run the macro. If you need to create a footer in your document, use Footer A instead.*
